

Scrutinizer Benefits

- 100% support for all flow technologies (NetFlow, J-Flow, IPFIX, sFlow, and derivatives)
- Massively scalable through a distributed deployment architecture
- Detailed threat forensics provides better incident response
- Network and application performance monitoring
- Dozens of default dashboards as well as highly customized reporting

Announcing Subscription-Based Pricing

Plixer is pleased to announce the addition of subscription-based pricing options for Scrutinizer*.

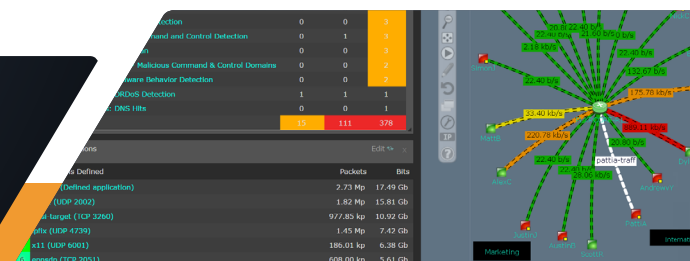

Benefits include:

- A lower upfront cost than perpetual licenses
- Maintenance costs are included
- Leverage an OPEX budget instead of CAPEX
- Flexible purchase options with no long-term commitments

About Scrutinizer

[Scrutinizer](#) is a Network Traffic Analytics system that collects NetFlow, IPFIX, sFlow, and metadata from existing infrastructure such as switches, routers, firewalls, etc. Data is centralized and correlated to provide security analytics and cyber threat forensics, improve network and application performance and reduce incident response times. Scrutinizer deployments range from small environments with just a few exporting devices all the way to large enterprises with hundreds of thousands of exporters. Thanks to Scrutinizer's distributed architecture, customers can start small, then scale to millions of flows per second. Scrutinizer is the go-to solution for small, medium, and large enterprises that want deep insight and context into the traffic on their network.

**Subscription Pricing Only Available for Virtual Instances of Scrutinizer*
